Library Website – Explanation

Activity-Based Learning | HTML and CSS Multi-Page Website

1. Introduction

This project is a simple library website made using HTML and CSS. It helps visitors explore books, browse book categories, learn about authors, check whether books are available, and read library rules. The website has a consistent dark-green header and navigation bar across its pages.

2. Main Pages and Their Purpose

Home page (index.html)

The main page introduces the library website. It usually contains the website title, a short welcome message, navigation links, and featured books or library information.

Categories page (categories.html)

Displays book categories such as Fiction, Science, Technology, and History. Each category includes a short description and may include a book image. It helps users find books based on their interests.

Authors page (authors.html)

Shows an author directory with names such as Paulo Coelho, Stephen Hawking, Robert C. Martin, and Ramachandra Guha. Author cards provide information about the author, a famous book, and a link to view the book catalog.

Availability page (availability.html)

Shows the availability status of library books in a table. The table includes Book Name, Author, Category, and Status. A green “Available” label means the book is ready to borrow; a red “Borrowed” label means it is currently on loan.

Library Rules page (rules.html)

Lists the rules readers should follow, such as maintaining silence, returning books on time, and handling books carefully. Each rule has a heading and a short explanation.

3. Explanation of the Website Design

Header: The dark-green top section contains the page title and subtitle. It gives every page a clear identity.

Navigation bar: The links Home, Categories, Authors, Availability, and Library Rules allow users to move between separate HTML pages. Each link must point to the correct file name, for example href="categories.html".

Content area: The light background makes text easy to read. Headings divide the information into sections.

Cards and labels: White cards with a colored left border highlight individual authors or rules. Rounded pale-green labels are used for categories and author names.

Table: The availability page uses a table so book details can be compared row by row.

Images: Book images make the categories page more attractive and help visitors recognize the type of content.

4. HTML Elements Used

<html> — The root element of an HTML page.

<head> — Contains page information such as the title and CSS link.

<title> — Sets the text shown on the browser tab.

<body> — Contains the visible page content.

<header> — Groups the page heading and subtitle.

<nav> — Groups navigation links.

<a> — Creates clickable links to other pages or resources.

<h1> / **<h2>** — Creates main and section headings.

<p> — Displays a paragraph of text.

<table>, **<tr>**, **<th>**, **<td>** — Builds the book availability table.

<img> — Displays a book image.

** ** — Groups related content so it can be styled with CSS.

5. CSS Properties Used

background-color: Sets the background color of the header, navigation bar, cards, or page.

color: Sets the text color.

font-family: Chooses the typeface.

font-size: Changes the size of text.

text-align: Aligns text, for example in the center of the header.

padding: Adds space inside an element.

margin: Adds space outside an element.

border: Adds a border around an element.

border-radius: Rounds the corners.

display / gap: Controls how items are arranged and the space between them.

width / max-width: Controls the width of content, including tables and cards.

6. How the Navigation Works

Each navigation item is an anchor link. For example, Authors opens authors.html when clicked. Keep all HTML pages in the same project folder, and make sure the file names in href attributes match the actual names exactly. If a link does not work, check spelling, file extension, and folder location.

7. How to Run the Project

1. Create one project folder for the library website.

2. Save each page with its correct name: index.html, categories.html, authors.html, availability.html, and rules.html.

3. Save the shared stylesheet as style.css, if the pages use an external stylesheet.

4. Keep image files in the expected folder and check each image path in the src attribute.

5. Open index.html in a browser. Use the navigation bar to open the other pages.

6. If a page or image does not open, check file names, href paths, and image src paths.

8. Advantages of the Website

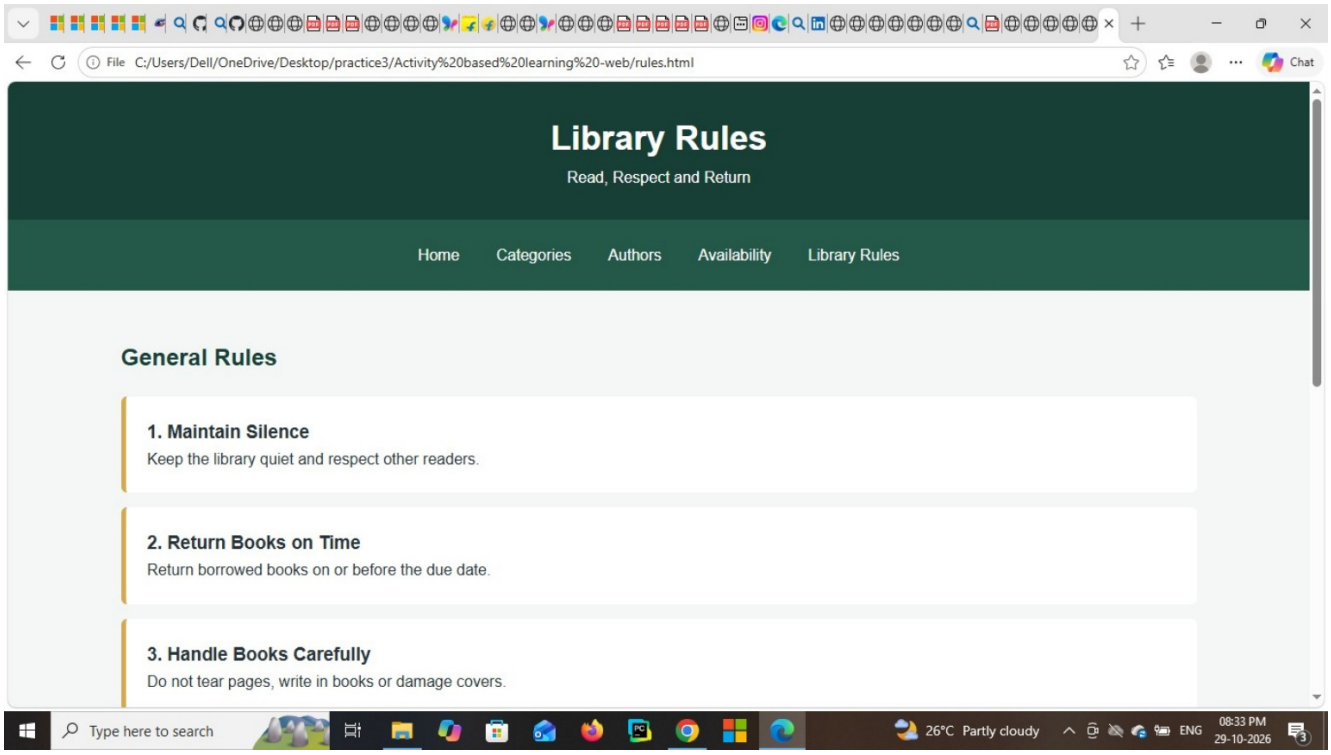

• Simple and easy to navigate
• Organizes books by category and author
• Displays book availability clearly
• Reminds visitors of library rules
• Uses a consistent design across multiple pages
• Provides practice with HTML links, tables, images, and CSS styling.

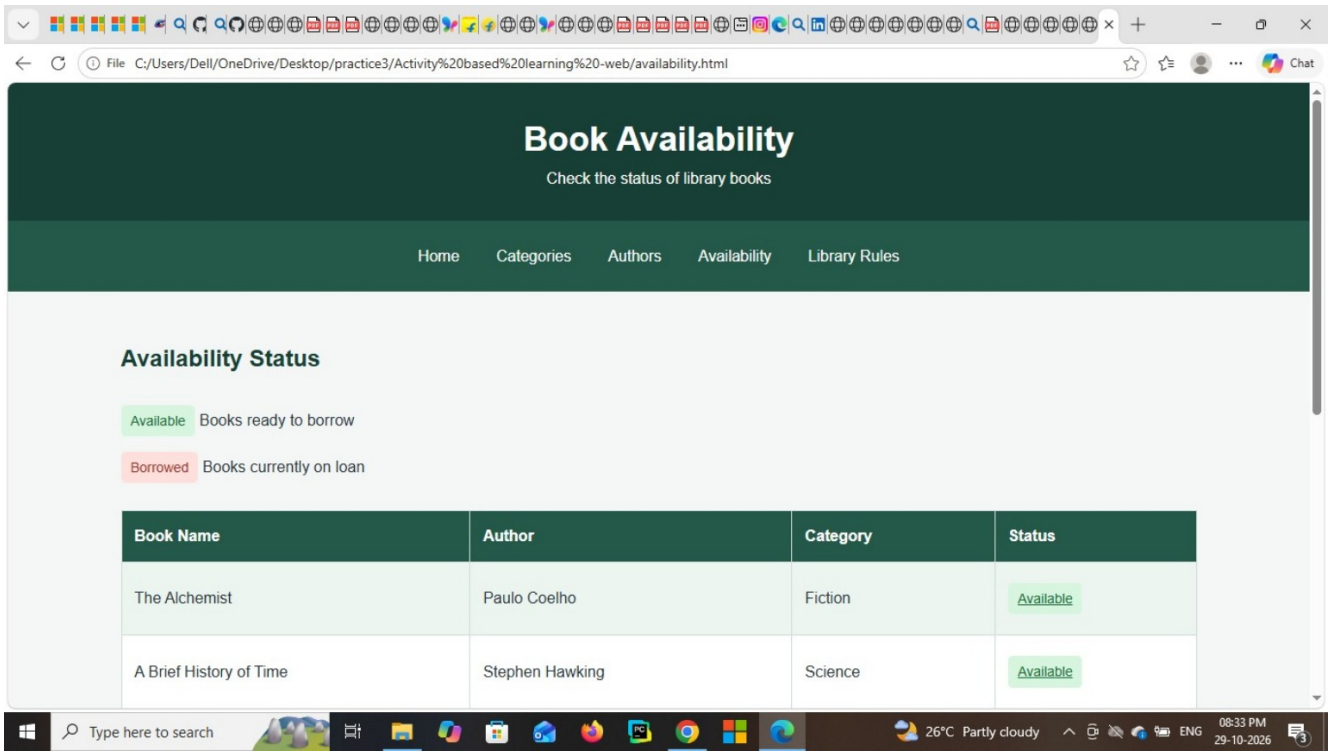

9. Conclusion

The Library Website project demonstrates how HTML structures web pages and how CSS improves their appearance. Its separate pages are connected by clickable navigation links, making it a useful beginner-level multi-page website project.

10. Screenshot References

The screenshots below show the pages described in this explanation.
