FITZONE FITNESS CENTER

HTML and CSS Website Project — Explanation and Viva Notes

1. Introduction

FitZone Fitness Center is a multi-page gym website created using HTML and CSS. It presents workout programs, trainers, fitness facilities, class schedules, membership plans, and a registration form. The website uses a black background, red highlights, white text, fitness images, clickable links, and hover effects to create a modern gym-style design.

2. Objectives of the Project

• To design an attractive website for a fitness center.

• To practise creating multiple HTML pages connected by links.

• To use CSS for colours, spacing, layouts, images, tables, forms, and transitions.

• To make the website responsive for tablets and mobile screens.

• To provide easy navigation between the website pages.

3. Files Used in the Website

File name	Purpose
index.html	Home page with the main banner, welcome message, and links.
programs.html	Displays workout programs such as strength training, cardio, yoga, and personal training.
trainers.html	Shows trainer profiles, images, and training specialities.
facilities.html	Displays gym equipment, yoga space, and workout areas.
schedule.html	Shows class timings in a table with links to register.
membership.html	Displays Basic, Standard, and Premium membership plans.
register.html	Contains a form for visitor details, selected program, membership, and fitness goal.
style.css	Shared stylesheet that controls the appearance of all HTML pages.

4. Explanation of the HTML Code

<!DOCTYPE html> — Declares that the document uses HTML5.

<html lang="en"> — Starts the HTML document and specifies English as the page language.

<head> — Contains the title, character set, viewport settings, and CSS link.

<meta name="viewport" ...> — Helps the page scale correctly on mobile phones and tablets.

<link rel="stylesheet" href="style.css"> — Connects the HTML page to the shared CSS file.

<header> and <nav> — Create the page header and navigation menu.

<a href="programs.html"> — Creates a clickable link that opens the Programs page.

<section> — Groups related content such as trainers, programs, or membership plans.

<img> — Displays an image; the alt attribute provides a text description.

<form> — Groups the fields used to collect registration details.

<label>, <input>, <select>, <textarea> — Provide labels, text fields, dropdowns, and a larger text area.

<table>, <tr>, <th>, <td> — Organise the class schedule into rows and columns.

<footer> — Displays closing information and footer links.

5. Explanation of the CSS Code

Universal selector (*) — Resets default margins and padding and uses border-box sizing.

body — Sets the font, dark background, white text, and line spacing.

header and nav — Use Flexbox to arrange the logo and navigation links.

.logo and span — Style the FitZone logo and highlight part of it in red.

.hero — Creates the home-page banner with a background image and dark overlay.

.btn — Styles clickable buttons and adds a smooth hover effect.

.cards — Uses CSS Grid to display cards in columns.

.card:hover — Moves a card slightly upward and changes its border colour when hovered over.

.card img — Sets a consistent image height and uses object-fit: cover to crop images neatly.

table, th, td — Style the class schedule, including borders, spacing, and red headings.

form, input, select, textarea — Style the registration form and its fields.

@media rules — Adjust the card layout and spacing for tablets and phones.

transition — Makes changes such as colour and movement appear smoothly.

6. How the Clickable Links Work

Each page contains navigation links to index.html, programs.html, trainers.html, facilities.html, schedule.html, membership.html, and register.html. Clicking a link opens the matching HTML file. Buttons such as “Join Program”, “Choose Plan”, and “Book” lead to the registration page. All HTML files and style.css should be saved in the same folder, and the filenames in each href attribute must match the actual filenames.

7. Registration Form

The form collects a visitor's name, email, phone number, workout program, membership plan, preferred start date, and fitness goal. The required attribute makes certain fields mandatory. The email input checks for a basic email format, and a phone pattern can require ten digits. A reset button clears the entered fields.

Limitation: The form is currently a front-end demonstration. It does not store registrations in a database or send them to the gym. A backend or form service is needed for real submissions.

8. How to Run the Project

• Create a folder named FitZone.

• Save all seven HTML files and style.css in that folder.

• Add the stylesheet link inside the head of every HTML page.

• Open index.html in Chrome, Edge, or another web browser.

• Click the navigation links to test each separate page.

• Use an internet connection to load the online images.

9. Advantages

• Separate pages keep the website organised.

• A shared CSS file keeps the design consistent.

• Hover effects make buttons and cards interactive.

• Responsive CSS helps the website fit smaller screens.

• The project demonstrates basic HTML and CSS skills.

10. Conclusion

The FitZone website demonstrates how HTML and CSS can be used to build a multi-page fitness website. HTML provides the content, links, tables, and form fields, while CSS controls colours, layouts, images, transitions, and responsive design. The project can be improved by adding a working registration backend and verified gym information.

11. Short Viva Questions and Answers

What is HTML?
HTML is a markup language used to structure web pages.

What is CSS?
CSS styles web pages using colours, fonts, spacing, and layouts.

Why use separate HTML pages?
They organise different parts of a website and make navigation clearer.

What does href do?
The href attribute specifies the destination of a link.

What is a CSS class?
A reusable name used to apply styles to HTML elements.

What is a media query?
A CSS rule that applies styles based on screen size or device conditions.

Why use alt in an image?
Alt text describes an image if it cannot load and supports screen-reader users.

Does the form save data?
No. A backend or form service is required to store or send registrations.
